We have, for example,

Theorem 4.1. Let the sets B, C belong to some PRC class $\mathscr{C}$. Then so do the sets $B \cup C, B \cap C, \bar{B}$.

Proof. This is an immediate consequence of Theorem 5.1, Chapter 3.
∎

As long as the Gödel numbering functions $[x_1, \ldots, x_n]$ and $(x)_i$ are availaole, we can restrict our attention to subsets of N. We have, for example,

Theorem 4.2. Let $\mathscr{C}$ be a PRC class, and let B be a subset of N^m, $m \geq 1$. Then B belongs to $\mathscr{C}$ if and only if

$$B' = \{[x_1, \ldots, x_m] \in N \mid (x_1, \ldots, x_m) \in B\}$$

belongs to $\mathscr{C}$.

Proof. If $P_B(x_1, \ldots, x_m)$ is the characteristic function of B, then

$$P_{B'}(x) \Leftrightarrow P_B((x)_1, \ldots, (x)_m) \ \& \ Lt(x) = m$$

is the characteristic function of B', and $P_{B'}$ clearly belongs to $\mathscr{C}$ if P_B belongs to $\mathscr{C}$. On the other hand, if $P_{B'}(x)$ is the characteristic function of B', then

$$P_B(x_1, \ldots, x_m) \Leftrightarrow P_{B'}([x_1, \ldots, x_m])$$

is the characteristic function of B, and P_B clearly belongs to $\mathscr{C}$ if $P_{B'}$ belongs to $\mathscr{C}$.
∎

It immediately follows, for example, that $\{[x, y] \in N \mid HALT(x, y)\}$ is not a computable set.

Definition. The set $B \subseteq N$ is called *recursively enumerable* if there is a partially computable function g(x) such that

$$B = \{x \in N \mid g(x)\!\downarrow\}. \tag{4.1}$$

The term *recursively enumerable* is usually abbreviated *r.e.* A set is recursively enumerable just when it is the domain of a partially computable function. If $\mathscr{P}$ is a program that computes the function g in (4.1), then B is simply the set of all inputs to $\mathscr{P}$ for which $\mathscr{P}$ eventually halts. If we think of $\mathscr{P}$ as providing an algorithm for testing for membership in B, *we see* that for numbers that do belong to B, the algorithm will provide a

Problem Solving in Automata, Languages, and Complexity Ding-Zhu Du,Ker-I Ko,2004-03-22 Automata and natural language theory are topics lying at the heart of computer science Both are linked to computational complexity and together these disciplines help define the parameters of what constitutes a computer the structure of programs which problems are solvable by computers and a range of other crucial aspects of the practice of computer science In this important volume two respected authors editors in the field offer accessible practice oriented coverage of these issues with an emphasis on refining core problem solving skills   *Computability, Complexity, Logic* E. Börger,1989-07-01 The theme of this book is formed by a pair of concepts the concept of formal language as carrier of the precise expression of meaning facts and problems and the concept of algorithm or calculus i e a formally operating procedure for the solution of precisely described questions and problems The book is a unified introduction to the modern theory of these concepts to the way in which they developed first in mathematical logic and computability theory and later in automata theory and to the theory of formal languages and complexity theory Apart from considering the fundamental themes and classical aspects of these areas the subject matter has been selected to give priority throughout to the new aspects of traditional questions results and methods which have developed from the needs or knowledge of computer science and particularly of complexity theory It is both a textbook for introductory courses in the above mentioned disciplines as well as a monograph in which further results of new research are systematically presented and where an attempt is made to make explicit the connections and analogies between a variety of concepts and constructions   **Introduction to Languages and the Theory of Computation** John C.
