A Mathematical Theory of Design: Foundations, Algorithms and Applications D. Braha, O. Maimon, 2013-04-17 Formal Design Theory PDT is a mathematical theory of design The main goal of PDT is to develop a domain independent core model of the design process The book focuses the reader's attention on the process by which ideas originate and are developed into workable products In developing PDT we have been striving toward what has been expressed by the distinguished scholar Simon 1969 that the science of design is possible and some day we will be able to talk in terms of well established theories and practices The book is divided into five interrelated parts The conceptual approach is presented first Part I followed by the theoretical foundations of PDT Part II and from which the algorithmic and pragmatic implications are deduced Part III Finally detailed case studies illustrate the theory and the methods of the design process Part IV and additional practical considerations are evaluated Part V The generic nature of the concepts theory and methods are validated by examples from a variety of disciplines FDT explores issues such as algebraic representation of design artifacts idealized design process cycle and computational analysis and measurement of design process complexity and quality FDT's axioms convey the assumptions of the theory about the nature of artifacts and potential modifications of the artifacts in achieving desired goals or functionality By being able to state these axioms explicitly it is possible to derive theorems and corollaries as well as to develop specific analytical and constructive methodologies

Genetic Algorithms in Engineering and Computer Science G. Winter, 1995
Genetic Algorithms in Engineering and Computer Science Edited by G Winter University of Las Palmas Canary Islands Spain
J P riaux Dassault Aviation Saint Cloud France M Gal n P Cuesta University of Las Palmas Canary Islands Spain

This attractive book alerts us to the existence of evolution based software. Genetic Algorithms and Evolution Strategies used for the study of complex systems and difficult optimization problems unresolved until now. Evolution algorithms are artificial intelligence techniques which mimic nature according to the survival of the fittest Darwin's principle. They randomly encode physical quantitative or qualitative variables via digital DNA inside computers and are known for their robustness to better explore large search spaces and find near global optima than traditional optimization methods. The objectives of this volume are two fold to present a compendium of state of the art lectures delivered by recognized experts in the field on theoretical, numerical and applied aspects of Genetic Algorithms for the computational treatment of continuous, discrete and combinatorial optimization problems to provide a bridge between Artificial Intelligence and Scientific Computing in order to increase the performance of evolution programs for solving real life problems. Fluid dynamics, structure mechanics, electromagnetics, automation control, resource optimization, image processing and economics are the featured multi disciplinary areas among others in Engineering and Applied Sciences where evolution works impressively well. This volume is aimed at graduate students, applied mathematicians, computer scientists, researchers and engineers who face challenging design optimization problems in Industry. They will enjoy implementing new programs using these evolution techniques which have been experimented with by Nature for 3.5 billion years.

Multiple Instance Learning Francisco Herrera, Sebastián Ventura, Rafael Bello, Chris Cornelis, Amelia Zafra, Dánel Sánchez-Tarragó, Sarah Vluymans, 2016-11-08

This book provides a general overview of multiple instance learning (MIL) defining the framework and covering the central paradigms. The authors discuss the most important algorithms for MIL such as classification, regression and clustering. With a focus on classification a taxonomy is set and the most relevant proposals are specified. Efficient algorithms are developed to discover relevant information when working with uncertainty. Key representative applications are included. This book carries out a study of the key related fields of distance metrics and alternative hypothesis. Chapters examine new and developing aspects of MIL such as data reduction for multi instance problems and imbalanced MIL data. Class imbalance for multi instance problems is defined at the bag level, a type of representation that utilizes ambiguity due to the fact that bag labels are available but the labels of the individual instances are not defined. Additionally, multiple instance multiple label learning is

explored This learning framework introduces flexibility and ambiguity in the object representation providing a natural formulation for representing complicated objects Thus an object is represented by a bag of instances and is allowed to have associated multiple class labels simultaneously This book is suitable for developers and engineers working to apply MIL techniques to solve a variety of real world problems It is also useful for researchers or students seeking a thorough overview of MIL literature methods and tools
