

Chapter 4: Algebraic Structures

Algebraic structures are mathematical systems consisting of a set of elements and one or more binary operations defined on that set. The study of these structures is fundamental in abstract algebra and has applications in various fields of science and engineering.

Groups and Subgroups

A group is a set G equipped with a binary operation \cdot that satisfies the following properties: closure, associativity, identity, and invertibility. A subset H of G is called a subgroup if H itself forms a group under the same operation.

Examples of groups include the integers under addition, the real numbers under multiplication, and the symmetric group of permutations on a finite set.

The study of groups is essential for understanding the symmetries of objects and the structure of mathematical systems. It provides a framework for analyzing complex mathematical phenomena.

Further exploration of algebraic structures leads to the study of rings, fields, and modules, which are central to modern algebra.
