

Responses to complex humanitarian emergencies and natural disasters: an analytical comparison

J M ALBALA-BERTRAND

ABSTRACT *This article analytically compares complex humanitarian emergencies with natural disasters, concentrating on disaster responses and interference with society. There are some important analytical differences between the responses to these two types of disaster, like overlapping and interactions, persistence and duration, access and timing, assistance involvement and intervention, physical and societal recovery, and others. However, the fundamental difference between natural and politically induced disasters is the way institutions are affected. In natural disasters, there can be some significant interference with society and therefore institutional change arising from both the impact effects and the responses, but this is infrequent, mostly incidental and not normally widespread or long-term. In complex emergencies, most aspects of the impact and effects have deliberate institutional aims and overtones. Likewise, the response to this type of calamity is also bound to cause significant interference with society, which may be intense, long-term and mostly deliberate.*

A natural disaster impact is primarily the outcome of a physically uncompensated interaction between an unleashing natural event and a social system, whereas a complex humanitarian emergency is primarily the outcome of an institutionally uncompensated interaction between an unleashing societal event and a social system. The latter has been defined as:

a purposeful and unlikely neutral *response*, intended mostly to counteract the worse effects of the massive human destitution that derive from an overt *political* phenomenon, which takes the form of a violent, entrenched and long-lasting factionalist conflict or imposition with *ultimate institutional aims*. (Albala-Bertrand, 2000a: 20 emphasis in the original).

As discussed there, a complex humanitarian emergency, or a complex emergency for short, appears to be implicitly embedded in a similar conceptual structure to that of the general disaster situation framework that was proposed by Albala-Bertrand (1993). Although this analytical framework was especially used to study natural disasters, its abstraction level makes it flexible enough to accommodate other types of disaster. This implies the articulation of three main categories of factors: (i) pre-disaster factors; (ii) disaster impact and impact
