Petit,2013-03-12 When I was a student in the early fifties the properties of gratings were generally explained according to the scalar theory of optics The grating formula which pre dicts the diffraction angles for a given angle of incidence was established exper imentally verified and intensively used as a source for textbook problems Indeed those grating properties we can call optical properties were taught in a satisfac tory manner and the students were able to clearly understand the diffraction and dispersion of light by gratings On the other hand little was said about the energy properties i e about the prediction of efficiencies Of course the existence of the blaze effect was pointed out but very frequently nothing else was

taught about the efficiency curves At most a good student had to know that for an eche lette grating the efficiency in a given order can approach unity insofar as the diffracted wave vector can be deduced from the incident one by a specular reflexion on the large facet Actually this rule of thumb was generally sufficient to make good use of the optical gratings available about thirty years ago Thanks to the spectacular improvements in grating manufacture after the end of the second world war it became possible to obtain very good gratings with more and more lines per mm Nowadays in gratings used in the visible region a spacing smaller than half a micron is common
